

Customer Journey Map

Ideation Phase — Empathize & Discover

Date	07 March 2026
Team ID	
Project Name	Insurance Fraud Detection Using Machine Learning
Maximum Marks	4 Marks

Customer Journey Map

A Customer Journey Map is a visual representation of the end-to-end experience a user has while interacting with the product. It captures every touch point, emotion, pain point, and opportunity for improvement across the user's interaction lifecycle.

For this project, the primary persona is an Insurance Claims Officer who uses the Insurance Fraud Detection system to review and score incoming claims.

Persona: Insurance Claims Officer

Attribute	Details
Name (Persona)	Priya Sharma — Senior Claims Officer
Role	Reviews and approves/rejects insurance claims across automobile and health segments
Goal	Process claims faster with higher accuracy using the fraud detection system
Frustrations	Manual review is slow; no standardised fraud scoring; hard to justify decisions without data
Device	Desktop browser (primary), mobile for alerts
Scenario	Logging in, submitting a claim, reviewing the ML fraud score, and taking action

Journey Map Diagram

Journey Map — Detailed Breakdown

Stage	Steps / Actions	Goals & Motivations	Positive Moments	Negative Moments	Areas of Opportunity
ENTICE (Awareness)	Claims Officer hears about the fraud detection tool from the IT department or management during a team meeting. Views a product demo.	Help me understand if this tool will genuinely reduce my workload and improve my accuracy without steep learning.	Excitement about automated fraud detection. Demo shows instant scoring which looks impressive.	Scepticism about whether ML predictions can be trusted as much as personal experience.	Show real accuracy stats (precision, recall, F1). Provide a recorded demo walkthrough. Share case studies from similar insurance companies.
ENTER (Onboarding)	Officer accesses the web portal, registers an account, and logs in for the first time using email or Google SSO.	Help me get set up quickly without having to read a lengthy manual.	Clean, intuitive UI is welcoming. The registration form is short and simple.	Confusion if too many fields are presented at once. Unclear what to do after logging in.	Add a guided onboarding walkthrough (3-step tour). Auto-populate known fields from company directory. Provide a sample claim to practice with.

Stage	Steps / Actions	Goals & Motivations	Positive Moments	Negative Moments	Areas of Opportunity
ENGAGE (Core Use)	Officer submits claim details (auto/health/property), views the fraud probability score, reviews the top contributing features, and makes an approve/reject/escalate decision.	Help me trust the prediction and act on it with confidence. Help me understand why the model flagged this claim.	Clear fraud verdict (FRAUD / GENUINE) with a colour-coded risk score. Explainable AI feature list helps justify decisions.	Borderline scores (0.45–0.60) create uncertainty. If no explanation is shown, officer must still rely on gut feeling.	Add confidence interval display. Show top 3–5 risk factors per claim (SHAP). Provide a 'Get Second Opinion' escalation button for borderline cases.
EXIT (Completing Review)	Officer marks claim as reviewed (approved/rejected/escalated), adds a note, and the system logs the decision with a timestamp.	Help me complete my review efficiently. Help me ensure the decision is properly documented for compliance.	Fast processing. Decision is automatically saved to audit trail. Officer receives confirmation notification.	Manual note entry can feel repetitive. No summary of daily fraud stats visible before logout.	Add end-of-session summary card (claims reviewed, fraud flagged today, time saved estimate). Pre-fill decision notes with ML justification text.
EXTEND (Post-Use)	Officer reviews weekly fraud analytics dashboard, sees trend reports, gives feedback on incorrect predictions via a thumbs-down button.	Help me track fraud patterns over time. Help me improve the system by flagging wrong predictions easily.	Actionable insights from trend charts. Officer feels empowered knowing their feedback improves the model.	Review fatigue if weekly reports are too detailed. Frustration if feedback is never visibly acted upon.	Send a brief weekly digest email with top fraud patterns. Show officers a 'Model improved based on your feedback' notification after retraining cycles.
