

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS Who is your customer? i.e. working parents of 0-5 y.o. kids The primary customers for this solution are Insurance Companies across various sectors, including Health, Auto, and Life insurance, who are currently facing significant financial leakage. Specifically, the segment includes Claims Adjusters and Fraud Investigation Units (SIUs) who require automated tools to handle high volumes of data. These customers are looking for a way to integrate advanced analytics into their existing workflow to distinguish between legitimate claims and organized scams.	6. CUSTOMER CONSTRAINTS CC What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices. Significant constraints prevent insurance companies from taking immediate action, such as limited spending power, budget allocations, or lack of liquid cash for high-end software. Technical barriers include unreliable network connections and a lack of available devices for field investigators to access real-time fraud data. These limitations often force teams to stick with existing, less efficient procedures rather than adopting advanced machine learning solutions.	5. AVAILABLE SOLUTIONS AS Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an alternative to digital notetaking Before adopting machine learning, insurance companies typically rely on manual auditing or traditional pen and paper methods to verify claims, which serve as a primary alternative to digital systems. Other common solutions include basic rule-based software that flags simple inconsistencies; however, these have significant "cons" as they struggle to adapt to sophisticated scams and high volumes. Customers may have also tried using general database queries to catch duplicates, but these methods often lack the predictive power needed to identify the "scams" that are actually being committed.	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS J&P Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides. The fundamental job is to accurately predict whether an insurance claim is a Fraud or a Legal Claim based on a variety of complex appeals and parameters. The problem being addressed is that the current rate of fraud detection is much lower than the actual number of fraudulent acts committed, which results in massive unrecovered losses for the company. This system aims to provide a reliable "relief amount" validation process to ensure protection from financial loss.	9. PROBLEM ROOT CAUSE RC What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in regulations. The real reason this problem exists is the systemic difficulty in identifying deceptive "scams" among a massive volume of legal claims. The back story often involves a change in regulations or sophisticated tactics used by claimants to obtain benefits they are not entitled to. Because the number of detected cases is much lower than those actually committed, the root cause is a lack of a scalable, automated way to verify complex appeals	7. BEHAVIOUR BE What does your customer do to address the problem and get the job done? i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace) To address the problem, customers currently perform actions directly related to fraud detection, such as hiring specialists to find the right investigators or manually calculating usage and policy benefits. Indirectly associated behaviors include staff spending free time on industry volunteering work or networking with groups like Greenpeace to understand broader ethical standards. These existing habits define how they currently attempt to get the job done before transitioning to an automated system.	
Focus on J&P, tap into BE, understand RC	3. TRIGGERS TR What triggers customers to act? i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news. Customers are triggered to act when they experience a high volume of "scams" that overwhelm manual review capacity. Another trigger is an internal audit revealing that the company is knowingly or unknowingly denying benefits or paying out fraudulent claims, causing a measurable drop in "relief amount" efficiency	10. YOUR SOLUTION SI If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour. The solution is a comprehensive Insurance Fraud Detection system that uses machine learning to predict if a claim is Fraud or Legal based on specific parameters. The development follows a structured "Epic" approach, including data preparation, exploratory visual analysis, and training multiple algorithms to ensure high accuracy. This project culminates in a best-fit model integrated with a Web Framework, providing a documented, step-by-step procedure for the company to secure its financial assets.		Identify strong TR & EM
	4. EMOTIONS: BEFORE / AFTER EM How do customers feel when they face a problem or a job and afterwards? i.e. lost, insecure > confident, in control - use it in your communication strategy & design. Before implementing a dedicated fraud detection system, customers (insurance providers) often feel lost, insecure, and frustrated because they are unable to identify professional scammers hidden within a high volume of legitimate claims. They face a sense of vulnerability, knowing that the number of undetected fraud cases is much higher than those actually caught, which leads to a loss of control over financial payouts. After deploying the machine learning solution, the emotional state shifts to feeling confident and in control. This transition occurs because the automated system provides a clear, data-driven validation procedure, allowing the team to communicate with claimants more effectively and design a more secure, transparent claim-handling strategy.	8.CHANNELS of BEHAVIOUR CH 8.1 ONLINE What kind of actions do customers take online? Extract online channels from #7 8.2 OFFLINE What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development. In the online channel, customers extract data and take actions through digital portals, focusing on information gathered from existing behavior patterns in section #7. For offline channels, they utilize physical customer development methods and traditional investigation techniques to verify claims. These channels represent the environment where the customer currently operates and where the new solution must eventually be integrated
